Hiring Team
Adobe

Dear Hiring Team,

I'm excited to apply for the Member of Technical Staff II role within the Adobe Captivate team.

With close to 5 years of experience in frontend engineering, I have been building scalable, data-intensive web applications using React, Angular, JavaScript, and TypeScript. In my current role, I work on high-usage dashboard and workflow systems, focusing on performance optimization, reusable component architecture, and reliable API integrations.

I have hands-on experience owning features end-to-end — from design discussions to implementation and production support — while working closely with product, backend, and QA teams in Agile environments. My work also involves optimizing application performance, debugging complex production issues, and improving system reliability.

Additionally, I have exposure to backend development using Node.js and Python, which has helped me understand system design and build more efficient, well-integrated frontend solutions. I enjoy solving complex problems and continuously improving code quality, performance, and user experience.

I am particularly excited about this opportunity because of the Captivate team's focus on building impactful, user-centric products in the digital learning space. The combination of product ownership, innovation, and engineering depth strongly aligns with my interests and growth goals.

I would welcome the opportunity to contribute to Adobe's product engineering efforts and continue growing in a high-impact environment.

Best regards,
Trina Sikdar
